The problems of the patellofemoral joint remain a challenge to the orthopaedic surgeon. In spite of many articles in scientific journals, an outstanding monograph, and several excellent textbook chapters, the patella is still an enigma in many respects. The etiology of patellar pain is controversial, and there is no completely satisfying explanation for its cause or its relationship to chondromalacia. Curiously, neither the widespread use of arthroscopy nor the advent of newer diagnostic tests such as CT scanning and magnetic resonance imaging have cast much light. Without a better understanding of why patellar disorders occur it is not surprising that there is no consensus on how to fix them. Arthroscopy has contributed little except to the patient's psyche. The currently most popular surgical treatment for recurrent dislocation of the patella was first described 50 years ago. One concrete advance, albeit a small one, is a better understanding of the role of anatomical abnormalities and patellofemoral dysplasia in patellar instabilities. It gives

me great pleasure that many of the contributors are, like Dr. Those who do not feel pain seldom think that it is felt. SAMUEL JOHNSON, *The Rambler*, no. 48 (September 1, 1750) Who among us has not experienced the suffering of a patient with chronic disease, who in addition to the vicissitudes of fatigue, anxiety, and frustration, must also deal with the suffering of pain? Who among us has not considered, and then reconsidered, whether a patient's complaints are worthy of a narcotic and thence worried about the social and legal implications of chronic use? Who among us has not refused pain medications to our patients for fear that use was turning into abuse? Finally, who among us would not have liked a clinical guide to a myriad of syndromes, all of which have pain as their common denominator, in the hopes of developing some strategy to prioritize treatment. Our purpose in preparing *The Pain Management Handbook* is to provide the information needed by clinicians to develop strategies that optimize pain management. It is the goal of the editors and authors that the present handbook, above all else, will be clinically useful. Its aim is to provide practical information regarding the diagnosis and treatment of disorders causing pain, along with tables and graphics to provide the busy practitioner with rapid access to relevant data.

Symptoms affecting the upper extremities, particularly nocturnal paraesthesias and numbness, should be identified as manifestations of carpal tunnel syndrome. Reduction of physical load factors together with conservative treatment options (night splint) are the primary management strategies in association with mild symptoms and findings. Nonspecific treatment (e.g. unnecessary physiotherapy) should be avoided. If the sensory disturbance is prolonged and ENMG reveals severe nerve entrapment, or if motor weakness develops, surgical management should be considered.
