Excerpt from In Scarlet and Silk: Or Recollections of Hunting and Steeplechase Riding Englishman a real and strongly-rooted love of it for its own sake. When, however, by means of the Rack, thumbscrews, Acts of Parliament, Police-court summonses, and other deadly weapons, the kill-joys of the world have finally succeeded in eliminating all such feelings from our breasts, surely then even the most sanguine and most patriotic amongst Us must begin to look anxiously for the advent of the aboriginal gentleman from New Zealand whom Macaulay has forewarned us shall one day indulge in the cheap, though draughty, entertainment Of sitting on the ruins of London Bridge. Child Neuropsychology, Volume 2: Clinical Practice attempts to bridge the gap between neurodevelopmental theory and clinical practice with a pediatric population. The focus is on some of the more common neuropsychological disorders encountered in children, along with neuropsychological evaluation, intervention, and treatment. Comprised of 11 chapters, this volume begins with an overview of issues and perspectives in clinical child neuropsychology, followed by a discussion on neurodevelopmental learning disorders in children. The neuropsychological basis of psychiatric disorders in children are then examined, together with epilepsy and closed-head injury as well as different approaches and issues relevant to neuropsychological evaluation of children. Subsequent chapters deal with the importance of soft signs and neuropsychological screening; neuropsychological assessment of children; actuarial and clinical assessment practices; and intervention and treatment. The book also presents an overview of how one might conceptualize and integrate differential

diagnosis of neurodevelopmental learning disabilities with appropriate curriculum-based intervention strategies. The final chapter considers the broader applications of behavioral neuropsychology. This book is relevant to clinical child or pediatric neuropsychologists, child or school psychologists, physicians interested in pediatric neuropsychological disorders, and other professionals who provide services to children with neurologically based disorders. It may also serve as a reference for audiologists, speech and language therapists, or educators.

What happened at 10 Rillington Place was so shocking and gruesome that even today everyone over a certain age still remembers the case with a shudder. In 1950, Timothy Evans was hanged for the violent murder of his baby daughter; he was also assumed to have murdered his wife. Then, less than three years later, another tenant, John Christie, was found to have killed at least six women, hiding their bodies in the garden, under floorboards and in a concealed kitchen alcove. Christie followed Evans to the gallows. It seemed unlikely that two murderers were living at 10 Rillington Place, and the evidence that emerged in the Christie case eventually led to Evans receiving a pardon. But there was also circumstantial evidence that Evans had indeed killed his wife and child. Crime student Edna Gammon firmly believes that Evans was guilty. In *A House To Remember*, she explains why.

Coastal marine systems are among the most ecologically and socio-economically vital on the planet. It is now widely acknowledged that coastal and marine environments are experiencing enhanced changes as a result of natural and anthropogenic induced causes. Physical impacts of climate change, such as sea-level rise and extreme inundation events, pose a considerable threat to coastal settlements and the coastal ecosystems that provision and support them. Increases in concentrations of greenhouse gases projected for the 21st century are expected to lead to increased mean global air and ocean temperatures. Anthropogenically induced global climate change has profound implications for marine ecosystems and the economic and social systems that depend upon them. The relationship between temperature and individual performance is reasonably well understood, and much climate-related research has focused on potential shifts in distribution and abundance driven directly by temperature. Climate Change and Coastal Ecosystems covers the pioneer of the coastal and marine resources sector review of potential impacts on shorelines, estuaries, coastal wetlands, coral reefs, and ocean margin ecosystems. It reviews recent advances in our understanding of the physical and chemical nature of climate change in coastal oceans. Also, it examines the likely ecological responses to climate change as well as the proximate effects of environmental change, including impacts on individuals, populations and communities are addressed.

The broader ecological responses that will emerge from these proximal impacts; emergent responses include alterations in biologically and socio-economically important patterns and processes ranging from primary productivity to biogeography to evolution are considered. This book considers major knowledge gaps and research needs in order to: assess the risk climate change poses to coastal settlements, coastal ecosystems and the interplay between the two; develop appropriate adaptation strategies for coastal settlements and ecosystems; and ascertain how land-based activities and adaptation strategies will influence the adaptive capacity of coastal ecosystems. This book will appeal to students, practitioners, as well as a beneficial guide for researchers working on riverine, estuarine, and coastal marine systems.

The Romans were the first great builders of bridges in the western world. Professor O'Connor, a civil engineer and expert in bridge construction, has examined a very large number of those bridges that still remain all over the Roman empire. In this book he presents a thorough listing and description of all known bridges, in many cases illustrating the construction of the bridges by his own photographs and sketches. Introductory chapters place the bridges in their geographical and historical contexts, with detailed maps of the empire-wide system of Roman roads and discussion of how these came to be constructed, and an investigation of the technology available to the Romans. Finally, in order to elucidate the principles used by the Romans in designing their bridges Professor O'Connor examines the proportions of the stone arches, and subjects the rules that emerge to modern structural analysis.
