### **New Short History of the Catholic Church**

### **A New Short Textbook of Anaesthetics, Intensive Care and Pain Relief**

First multi-year cumulation covers six years: 1965-70.

### **A New Short Textbook of Microbial and Parasitic Infection**

This book is written with occupational therapy students in mind, as a guide to newly qualified occupational therapists and for those returning to work after a break in service. Over the years I have been asked many times by newly appointed

staffwhether I could recommend a book to prepare them for working with orthopaedic patients. I hope this small volume will fill the gap in the literature on the subject, and that it will be useful as a quick reference book. I hope it may also fall into the hands of those in other disciplines and enable them to understand and appreciate the contribution of the occupational therapist to the rehabilitation team. This is the era of joint replacement, with ever-increasing demand for primary and revision surgery. Improved implants and improved surgical techniques are constantly being researched. Surgery for bone tumour is less mutilating and more hopeful than ever before. Operations to release tendons and soft tissue contractures, tendon transfers, osteotomies, spinal fusion, joint fusion, etc. are performed on patients with neurological problems, thus improving function and appearance and preventing further deformity. These are some examples of procedures in this exciting and fast-developing field, while hospital beds are occupied for an ever shorter period of time and the potential for occupational therapy is enormous. 'If surgery is to be successful, the importance of assessing the patient as a human being cannot be over-emphasised' (Souter, 1987). This is precisely the approach of the occupational therapist.

## **New Short History of the Catholic Church**

The new edition of this highly successful text brings it fully up to date with recent developments in surgical nursing, and includes a new chapter on perioperative stress and anxiety. The need for surgical nurses to remain at the cutting edge in relation to their knowledge and skills has never been greater, as the demands of higher patient throughput and reduced hospital stays take their toll. *Nursing the Surgical Patient* is written for, and by, nurses. It adopts a patient-centred approach to the care of people requiring a wide variety of surgical procedures. Compiled by experienced practitioners and educators in the field, it covers relevant anatomy and physiology, investigations, brief information on relevant medical conditions leading to surgery, an outline of the surgical procedures and the nursing care the patient will require. The key nursing care

issues are described and explored, with case studies and care plans to bring theory to life. Comprehensive and research-based, yet accessible and engaging, *Nursing the Surgical Patients* a vital companion to nurses caring for surgical patients in either the primary or secondary care setting. This title is directed primarily towards health care professionals outside of the United States.

## **A Short Textbook of Clinical Imaging**

Here is a one-volume history of the Christian people from Pentecost to the present day, with principal focus on the Catholic Church. Having passed AD 2000 it seems appropriate and necessary to have a new short history of the first two millennia of the Christian era. In the last half century there has been a massive amount of research into Church history, published in learned articles and in multi-volume works. Full notice is taken of these recent scholarly initiatives in writing this short account, which is also eminently readable. In each section there is a balance between the institutional and the more directly religious dimensions of the Church - here are some of the elements: bishops, canon law, charity, councils crusades, devotions, heresies, laity, liturgy, martyrs, missionaries, parishes, pilgrimages, popes, prayer, priesthood, religious orders, sacraments, schools, theologians, universities and the vita consacrata. The scope is wide; the pace of the narrative is attractive.

## **Short Textbook of Medical Diagnosis and Management**

## **A New Short Textbook of Psychiatry**

## **A New Short Textbook of Anaesthetics, Intensive Care and Pain Relief**

First published in 1973, this well-established textbook offers medical students and junior doctors a readable introduction to the principles of public health with special reference to the situation in the developing countries of the tropics. This fifth

edition has been thoroughly revised to reflect recent advances in public health, while retaining the popular approach of previous editions in stressing basic principles illustrated by selected examples highly pertinent to the regions in question. Infectious diseases continue to feature strongly, and are grouped epidemiologically based on the mode of transmission and the public health approaches for their control. The fifth edition also features an expanded section on non-communicable diseases, including the global epidemiology of type II diabetes, chronic heart disease, and smoking-related diseases, with particular reference to the problems associated with their management in developing countries. Written for those studying in, or planning to undertake work in, developing nations, the new edition continues to recognise the wide diversity in the situations seen in different countries and concentrates on delivering basic principles that can readily be adapted to local conditions.

## **A New Short Textbook of Orthopaedics and Traumatology**

First published in 1973, Short Textbook of Public Health Medicine for the Tropics, Fourth Edition was designed to provide medical students and other trainees with an introduction to the principles of public health with special reference to the situation in developing countries of the tropics. Rather than attempting to provide a detailed comprehensive account, the book retains the approach from earlier editions that stresses basic principles illustrated by selected examples. Infectious diseases feature strongly in the textbook and diseases are grouped epidemiologically, based on the mode of transmission and the public health approaches for their control. This fourth edition also highlights the global epidemiology of Type II diabetes and effects from smoking as examples of the growing incidence of chronic disease in developing countries. Written primarily for the developing world, the book recognizes the wide diversity in the situation in developing countries and stresses basic principles that can be adapted to local situations.

Material Discourses of Health and Illness applies discursive approaches to the field of health psychology, in stark contrast to the bio-medical model of health and illness. The discursive approach uses the person's experience and feelings as the central focus of interest, whereas the more traditional models regarded these as coincidental and relatively unimportant. The book provides an accessible and compelling introduction to social constructionist and discursive approaches to those with limited previous knowledge of socio-linguistic theory and research. It provides practical examples of how these approaches can be applied to the field of health psychology with a collection of sophisticated discursive analyses which demonstrate the distinctive contribution that can be made by psychologists to a field that has been largely dominated by sociologists and anthropologists.

In recent decades imaging has proved one of the most rapidly expanding areas of medicine. The present day trainees entering radiology are no longer trained by radiologists who cover and are well informed on most aspects of their specialty as was the case with previous generations. Instead they encounter a confusing array of subspecialists divided both by systems and by techniques. The system specialists include neuroradiologists, vascular radiologists, gastrointestinal radiologists, chest radiologists, and skeletal radiologists. Technique specialists include experts in nuclear medicine, ultrasound, computed tomography and magnetic resonance, and there are subspecialists in both groups, not to mention others like pediatric radiologists who fit into neither classification. It is our experience that this plethora of experts each with his own individual approach is bewildering and intimidating to the novice radiologist. The numerous monographs on individual subjects and techniques and the large textbooks so valuable to the more advanced radiologist are also confusing and unhelpful to the new recruit. It was for these reasons that we decided to embark on this new Short Textbook. The aim was to produce a concise and integrated volume which could provide the beginner with a balanced and realistic view of the true place of different imaging techniques in current practice. Details of technique are generally excluded; most will be inevitably absorbed with increasing practical experience. The emphasis throughout is on clinical usage, and the relative and often changing importance of different methods in specific clinical contexts.

“In twenty-nine separate but ingenious ways, these stories seek permanent residence within a reader. They strive to become an emotional or intellectual cargo that might accompany us wherever, or however, we go. . . . If we are made by

what we read, if language truly builds people into what they are, how they think, the depth with which they feel, then these stories are, to me, premium material for that construction project. You could build a civilization with them.” —Ben Marcus, from the Introduction Award-winning author of Notable American Women Ben Marcus brings us this engaging and comprehensive collection of short stories that explore the stylistic variety of the medium in America today.
