Advanced Economic Theory

Remarkable developments have taken place in the domain of political theory in the present age of liberalisation and globalisation. The concept of the nation-state has undergone a major change on account of the irresistible erosion of sovereignty in the internal and external spheres and the emergence of the model of a transnational state. Different models of state may be seen in the countries of the Third World. It has put a question mark on the future of the nation-state. The basic tenets of liberalism have been challenged by Neo-liberalism and Communitarianism with the result that now it is on the retreat. In the post-World War II period, the New Fabians had revised the tenets of Fabianism, but in the post-Cold War era it has been replaced by the Third Way. The pluralists had attacked the classical theory of sovereignty, but the neo-pluralists have given a new shape to it. The theme of political legitimacy has been revisited. The old concept of citizenship requires to be reinterpreted in the contexts of civic republicanism, multiculturalism and identity politics. It has happened with other themes as well which may be taken note of in the emergence of new topics like Neo-colonialism, Post-colonialism, Post-communism and the like. The task of a political scientist is to comprehend and critically describe the underlying principles of political behaviour in their empirical as well as normative dimensions. Inter-disciplinary focus has become so popular now that the implications of the themes of various social sciences have penetrated into the domain of each other. The discipline of political science has become a study of 'power' and of 'struggle' for its sake at any level -- local, regional, national and international. In the light of these salient features, university courses have been modernised, and the author has done well to cover them in this work so as to adequately meet the requirements of students offering this course at the degree and postgraduate levels and of candidates preparing for

competitive examinations.

It provides a solid understanding of the basic concepts of the laws of thermodynamics as well as their applications with a thorough discussion of phase and chemical reaction equilibria. At the outset the text explains the various key terms of thermodynamics with suitable examples and then thoroughly deals with the virial and cubic equations of state by showing the P-V-T (pressure, molar volume and temperature) relation of fluids. It elaborates on the first and second laws of thermodynamics and their applications with the help of numerous engineering examples. The text further discusses the concepts of exergy, standard property changes of chemical reactions, thermodynamic property relations and fugacity. The book also includes detailed discussions on residual and excess properties of mixtures, various activity coefficient models, local composition models, and group contribution methods. In addition, the text focuses on vapour-liquid and other phase equilibrium calculations, and analyzes chemical reaction equilibria and adiabatic reaction temperature for systems with complete and incomplete conversion of reactants. **key Features** □ Includes a large number of fully worked-out examples to help students master the concepts discussed. □ Provides well-graded problems with answers at the end of each chapter to test and foster students' conceptual understanding of the subject. Modeling games provides a deeper understanding of computational models in general. Researchers in artificial intelligence have looked to chess as a model of thinking that can be automated while those in distributed computing and cryptography need models that reflect the competitive nature of distributed and

cryptographic protocols. Computational Models of Games describes a model of two person games - called a probabilistic game automaton - that unifies other important models that have been developed to reflect the game-like properties of computational problems. It also covers interesting models of games not previously studied (introducing games against unknown nature, for example) and proves new results on time bounded game automata, space bounded game automata with complete information, and space bounded game automata with partial information. By incorporating the three important features of randomness, secrecy, and limited power for the players, the probabilistic game automaton models in a natural way many problems that computer scientists confront and provides insight into their complexity. It generalizes computational models such as the alternating Turing machines of Chandra, Kozen, and Stockmeyer, Papadimitriou's games against nature, the Arthur-Merlin games of Babai, and the interactive proof systems of Goldwasser, Micali, and Rackoff. Anne Condon received her doctorate from The University of Washington and is Assistant Professor at The University of Wisconsin. Computational Models of Games is a 1988 ACM Distinguished Dissertation.

Macroeconomics

This book is for students with little or no previous knowledge of economic theory who intend to study the subject systematically and provides a general introduction to the theory while not including the special problems of international trade, public finance and welfare economics. Some parts of the book will be useful to more advanced students. The changes in this edition concentrate on the developments in macro-economic theory resulting from the interaction recently between the 'monetarists' and 'Keynesians', and one chapter now gives an account of 'monetarism' and the succeeding chapter presents the refinements and extension of Keynes' own ideas.
